What's New in SignWriter 4.4?

1. Improved Export Command creates BMP-SignWriter files, placing them on a white background automatically, with better quality than the old PCX format.

2. SignWriter-PDF files can be created if you own SignWriter 4.4 and Adobe Acrobat. This new feature makes it possible to "print to a postscript file", which Acrobat can convert into PDF format.

The SignWriter-PDF files can be opened, read and printed on Macintosh, Windows, and Unix platforms, reaching a wider audience. This also solves printing problems. Do you have a printer that refuses to print from the old SignWriter 4.3? Well...now this is solved with SignWriter-PDF files!

3. More countries (17), more spoken languages (10), ColumnMaker, better shareware to give to others, and 9 instruction documents in Acrobat PDF format which you can read on screen, or print for future reference.

4. Certain problems in SignWriter 4.3 are now fixed. The program works smoother.
