Installation of PocketPuddle for Mac

NOTE: These install instructions assume that you have not modified the built in web server included in OS X.

1

Turn on default web server

Open the System Preferences and start the personal web server

- Finder >> Applications >> System Preferences
- Select service "Personal Web Sharing"
- Press Start

2

Install PHP 5

The PocketPuddle requires PHP 5. The easiest way to install PHP 5 for Mac OS X 10.4 is to use a package created by <u>Entropy</u>. I have included the latest version available in the zip file: entropy-php-5.2.1-1.tar.gz. Open the file and follow the instructions.

Older versions of OS X will require PHP 5 installed with the GD Graphics library and allow_url_fopen enabled.

TAR	
entropy-php-5.2.1-1.tar	entropy-php-5.2.1-1.tar.gz entropy-php.mpkg
:54	Install Entropy PHP 5.2.1-1 This package contains a program that determines if the software can be installed. Assume surgeous program to a second
(Annual)	If you're not sure about the source of this package, click Cancel to prevent it from running the program
	and installing the software.

Find and clear the web server directory

Open the finder and select the main hard drive. Select Library >> WebServer >> Documents

By default, this folder contains files that can be and should be deleted. Delete the files that in Documents:

Find and copy the SignPuddle files

Plug in the PocketPuddle. It should be recognized as an external drive.

Open the finder and select the PocketPuddle drive.

Select diskw >> www

Select the contents of this folder and copy

Paste the files to the Mac's web server directory

Open the finder and select the main hard drive. Select Library >> WebServer >> Documents

Paste the files.

Get commands to fix file and folder permissions

Included in this folder (the Mac Pack), there is a file named **fixit.php**. The **fixit.php** file needs to be copied to the web server directory in the newly copied update folder.

Find fixit.php and choose Copy:

Fix permissions with Terminal

Open the terminal application Finder >> Applications >> Terminal

Type cd /Library/WebServer/Documents and press return.

Paste the text copied from the section above (menu item - File >> Paste). You'll see a bunch of commands get processed. When they stop press return again and close the terminal.

Congratulations!

If you made it this far, you should have a working SignPuddle install on you mac. In your favorite web browser you can now open the URL <u>localhost</u> and start using SignPuddle.
